

my project is((retrieving the data from zip file containing different extension like pdf,txt,word,html,css,js, ect....) example the zip file name is myproject in that two folder one is document another is website in document folder one pdf is there about the project another folder named website contain html,css,js file .On uploading the zip file the OUTPUT should display the structure like:: myproject ->website->index.html

->style.css

->script.js

->document->project.pdf

then it should display the text in the file like ::

index.html:about forms with field of name,place,age, weight, height

style.css :about use red black pink color and center aligned

script.js :about use onSubmit() function to verify the detail and upload to googlesheet name sheet1 and stored using appscript

project.pdf:about introducing

) generate this project using rag
